

The next big thing in digital radiography...

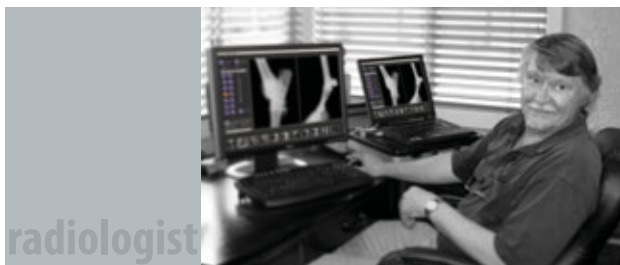

...is half the size of the last big thing.

“As an academic radiologist and equine consultant for the past thirty years, I have witnessed the digital imaging revolution, first hand. In developing the new TruDR equine imaging algorithm, I worked closely with Sound Technologies to create a new gold standard for equine digital images. Today, TruDR images combine accuracy, consistency, and detail with the broadest range of useful information available anywhere. TruDR images are simply superior to those produced by older flat-film or digital technologies.”

Dr. Norman Rantanen, DACVR

The benefits of Digital Radiography are well known. Instant images, no cassettes, and superior image quality are just a few. To date, vendors have provided these benefits via repackaged medical units backed by entrepreneurial sales zeal. Veterinarians wanted more. Sound Technologies took the challenge.

Sound Technologies set out to develop a new digital radiography solution, from the ground up, specifically for veterinary specialists. We began with a blank sheet of paper and open ears. Users of first generation DR systems consistently provided the same wish list. They dreamed of a smaller form factor, fewer cables, improved work flow, upgradeability, veterinary work flow, improved image quality, and a "barn-proof", temperature stable solution. We delivered.

The strategy was simple. Invest resources into creating the perfect field imaging tool without the limitations of an imperfect starting point.

The result is TruDR™. Enjoy.
